1. Description

The STK-616AM8 series current sensor is based on TMR (tunnel magnetoresistance) technology and open-loop design. It is suitable for DC, AC pulsed and any kind of irregular current measurement under the isolated conditions. The STK-616AM8 series current sensor has built in OCD (Over Current Detection) function. The primary conductor has very low resistance of 0.27mΩ.

- The product is packaged in standard SOIC10 form.
- AEC-Q100, automotive qualified.

Typical applications

- AC Variable speed driver
- AC/DC, DC/DC power supply
- PV inverter

Figure 1. Relationship between STK-616AM8 Case temperature and amount of input current.

Figure 1 shows the results of current & temperature measurement. Tested by using a standard demo test board, with 4 layers of copper conductors, where the thickness for each layer is 2 oz, the total thickness of demo board is 1.6 mm. This result is a reference data. Tc is changed much by the board layout and the heat dissipation. Please confirm it in your evaluation environment.

12. Typical application circuit

Figure 7. The reference application circuit for the STK-616AM8 series products.

Remark 1: $R3 = 10\text{ k}\Omega$, recommended $C1 = 100\text{ nF}$, $C2 = 4.7\text{ }\mu\text{F}$, $C3 = 100\text{ pF}$, $C4 = 100\text{ pF}$. 100 pF of $C4$ does not affect the response speed of the chip. $R2$ and $C4$ constitute RC filter circuit ($f \approx 1/(2\pi RC)$). The bandwidth of STK-616AM8 is 600 kHz , and RC filter circuit above 600 kHz cannot realize a bandwidth above 600 kHz . If the VREF pin is not used, it can be left empty. If there is a need for an external capacitor, it is necessary to ensure that the capacitance value is greater than 100 nF .

Remark 2: The VREF and VOUT pins cannot be connected directly to a capacitor. If a capacitor is required in the circuit, connect a resistor in series before the capacitor. It is recommended to select a series resistance of $100\text{ }\Omega$ or more.

13. OCD function for STK-616A-50ML8B5

Figure 8 the relationship of trigger current and VOC setting for the STK-616A-50ML8B5, with $V_{cc} = 5\text{ V}$. $I_{\text{trigger_pos}}$ represents the forward over-current protection trigger current. $I_{\text{trigger_neg}}$ represents the negative over-current protection trigger current. $I_{\text{pn_pos}}$ represents the forward primary nominal current. $I_{\text{pn_neg}}$ represents the negative primary nominal current. K is OCD coefficient, with typical values of 1, 2. I_{pn} is shown in the electrical data table.

14. General information on OCD

This section describes the general information on OCD function, the specific functions, which are not listed in the section of “electrical data”, can be defined per request.

Since the trigger voltage is set after the second amplifier, the OCD function supports that the trigger current can be higher than I_{pn} . The trigger voltage and the trigger current are shown as follows.

- a) $V_{cc} = 5\text{ V}$, $V_{ref} = 2.5\text{ V}$, $V_{off} = 2.5\text{ V}$, $K=1$.
- $0.3\text{ V} \leq \text{VOC} \leq 3.3\text{ V}$;
 - $V_{\text{trigger}} = V_{ref} \pm K * \text{VOC} / G3$;
 - $I_{\text{trigger}} = (V_{ref} \pm K * \text{VOC} - V_{off}) / G_{th}$;
- b) $V_{cc} = 5\text{ V}$, $V_{ref} = 2.5\text{ V}$, $V_{off} = 2.5\text{ V}$, $K=2$.

 - $V_{\text{trigger}} = V_{ref} \pm K * \text{VOC} / G3$;
 - $I_{\text{trigger}} = (V_{ref} \pm K * \text{VOC} - V_{off}) / G_{th}$;
